

ContourSpect

ContourSpect makes ULD's 100% fit to fly

ContourSpect

get your ULD build up right at first try.

Our software is developed to help build ULD's more efficiently and increase the load, which in turn reduces climate impact. Our latest innovative solution help air cargo companies around the world save money, time and labor.

Let's get started!

stereo vision technology software

ContourSpect creates a 3D model when the cargo is loaded on the air cargo pallet. The 3D model is then in real time compared with the selected virtual contour.

ContourSpect is your tool to eliminate manual measurements and time consuming quality control, the system will indicate if the build up is out of contour.

ContourSpect makes ULD's 100% fit to fly.

the benefits

Improve your cargo operation

Optimize each ULD pallet build up and carry more cargo in each shipment.

Automate your processes

Improved performance without validations from manual measurements and contour checks. A digital tool help companies streamline the onboarding process for new employees, allowing them to quickly become productive members of the team.

Collect master data

Collect information about important data points quickly and accurately. All data points are stored in a cloud-based dashboard.

No rebuilds

An over-stacked aircraft pallet leads to huge time delays as it needs to be repacked. ContourSpect shows you whether you are loading within or outside the contours of the ULD-pallet, in real time, to ensure correct build-up of pallets.
